Dice experiment : No dice experiment. I was absent from the first class. 08/26/2025

Interesting facts while reviewing the data results :

1. Males average an age of 53's and female in their early 50's which also surprised me was that trans and others are younger between their mid 30's and mid 40's compared to the rest. This stood out as a demographic sample compared to the rest.
2. High proportion of individuals with advanced degrees. Which made me think that higher education reduces poverty rates.
3. Unexplained trend is that advanced degree holders tend to have less chiidren compared to high school graduates, associate degree graduates, and those with some college. What is causing this trend and how could this be explained if higher income means you can afford having more children usually.
4. Anxiety levels seem moderate. However, this data shows that higher anxiety is linked to job loss and lack of health insurance which are main factors for a person's well being.
